PSA: You can run two Mullvad WireGuard tunnels on one machine and double your speed

Information

This only clicked for me recently so figured I'd share.

Mullvad gives you 5 devices per account. Nothing stops you from registering two (or more) of those devices on the same computer and loading separate WireGuard configs.

Once you have two tunnels up to two different Mullvad servers, you use ECMP (Equal-Cost Multi-Path) routing on top. Basically the kernel spreads your connections

This is super clever.

Why do I need to double my speed when I already hit 1 gig?

ori121212 OP · 8mo ago
If you're on a 2.5gbit or 10gbit fiber connection then you're leaving a lot on the table.

If you only have a 1 gig connection then load balancing across multiple servers could give you more consistent throughput. A diverse selection of servers could protect you against congestion upstream of your ISP. It's how most of the high availability networks across the web operate.

ISP is the limit.

Due_Wallaby_3101 · 8mo ago
Always capped by your ISP speed ofc.

This might be faster sure, but I'd have to think this would greatly diminish anonymity. Any attacker monitoring the ingress and egress of the VPN servers themselves would have to notice your connection using both the server and both the exit nodes connecting to the same endpoint after exiting the tunnel. Boom, that connection is clearly you.

Maybe you aren't concerned and that's fine, but you should probably warn people of the implications.
